

- Introducing a New Way to Identify and Remedy Floor Problems in the Design Process

USING YOUR CONTROL PANEL

Hide or unhide the control panel →

If you would like to ask a question, please type it here. →

We will try to answer your question before the end of the presentation

BC FloorValue®

- Most floor systems are designed to meet deflection criteria. Even when a floor system has an acceptable deflection L/ratio it can still fail to meet occupant expectations due to items such as vibration, support beam deflection and sheathing deflection between joists

- BC FloorValue® considers the system as a whole instead of as isolated members
- BC FloorValue® includes the contribution of sheathing span between joists to overall feel
- BC FloorValue® provides value-added options for efficient upgrading or cost optimization without impacting feel
- IMPORTANT: BC FloorValue® is not a structural analysis.
Design Members must be run to ensure structural adequacy of modeled members or new framing options.

BC FloorValue®

What it is not

- Not a structural analysis, Premium floors may have failing members (i.e. reaction failure)
- Not a footfall/impact analysis, floors may still have localized vibrations due to isolated foot traffic
- Not a replacement for good design and good judgment, but is a tool for assisting with better decision making

BC FloorValue®

Multiple distinct components make up the BC FloorValue® analysis

1. Deflection map
2. Vibration analysis
3. Sheathing analysis
4. System cost comparisons

Setting BC FloorValue® Material Selections (prior to version 8.2.3)

Floor Container – Select the Floor Container then click on the BC FloorValue® Material Selections dropdown arrow.

- Set a Material List for Joist and Decking Materials.
- Left click to select OCS, Joists and Decking materials you wish to consider.

NOTE: These selections can be set as defaults for a Floor Container scheme in Manage Job Defaults. Each new Floor Container will have your selections preset.

The screenshot shows a 'Properties' window with a 'Scheme Information' section. Below it, the 'Selected Edge Accessory' section is expanded, showing 'Application' set to 'Match Container Default', 'Type' set to 'Rim', and 'Material' and 'Plies' also set to 'Match Container Default'. The 'Floor Performance Options' section is also expanded, showing 'BC FloorValue Material Selections' set to '11-7/8" BCI® 6000-1.8 DF'. A dropdown arrow is visible next to this selection.

Below the Properties window is a 'Joist Material List' dialog box. It has two dropdown menus: 'Joist Material List' set to 'Boise West I's' and 'Decking Material List' set to 'Sheet Material'. There are four checkboxes for joist spacing: '12" o.c.' (unchecked), '16" o.c.' (checked), '19.2" o.c.' (checked), and '24" o.c.' (checked). The 'Joist Material' list is expanded, showing a table of material options with checkboxes:

Joist Material	Selected
9-1/2" joist	<input checked="" type="checkbox"/>
9-1/2" BCI® 5000-1.7 DF	<input checked="" type="checkbox"/>
9-1/2" BCI® 6000-1.8 DF	<input checked="" type="checkbox"/>
9-1/2" BCI® 6500-1.8 DF	<input checked="" type="checkbox"/>
11-7/8" joist	<input type="checkbox"/>
11-7/8" BCI® 5000-1.7 DF	<input checked="" type="checkbox"/>
11-7/8" BCI® 6000-1.8 DF	<input type="checkbox"/>
11-7/8" BCI® 60-2.0 DF	<input type="checkbox"/>
11-7/8" BCI® 6500-1.8 DF	<input checked="" type="checkbox"/>
11-7/8" BCI® 90-2.0 DF	<input checked="" type="checkbox"/>
14" joist	<input type="checkbox"/>

At the bottom of the dialog box are buttons for 'Select All', 'Deselect All', 'OK', and 'Cancel'.

Setting BC FloorValue® Material Selections (prior to version 8.2.3)

Beam – Select the Beam then click on the BC FloorValue® Material Selections dropdown arrow.

- Set a Material List for Beam Materials.
- Left click in the Ply column(s) to select Beam materials you wish to consider.

NOTE: Creating Beam schemes in Manage Job Defaults with unique beam products and BC FloorValue® Material list selections will speed up beam input. Beam schemes can be changed in the properties dialog with the Current Scheme property. When a scheme is selected it will contain your defined BC FloorValue® Material Selections.

The image shows two parts of a software interface. On the left is the 'Beam Material List' dialog box, and on the right is the 'Scheme Information' properties panel.

Beam Material List Dialog:

- Beam Material List: Boise West Beams
- Table with columns: Beam Material, 1 Ply, 2 Ply, 3 Ply
- Buttons: Select All, Deselect All, OK, Cancel

Beam Material	1 Ply	2 Ply	3 Ply
<input checked="" type="checkbox"/> 1-3/4" x 11-7/8" VERSA-LAM® 2.0 2800 DF	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/> 1-3/4" x 14" VERSA-LAM® 2.0 2800 DF	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Setting BC FloorValue[®] Material Selections (as of version 8.2.3)

- Prior to 8.2.3- we used both “Floor Performance” & “Advanced Material Selection” to set the consider list.
- Now, the consider list for joist is set in just one place.

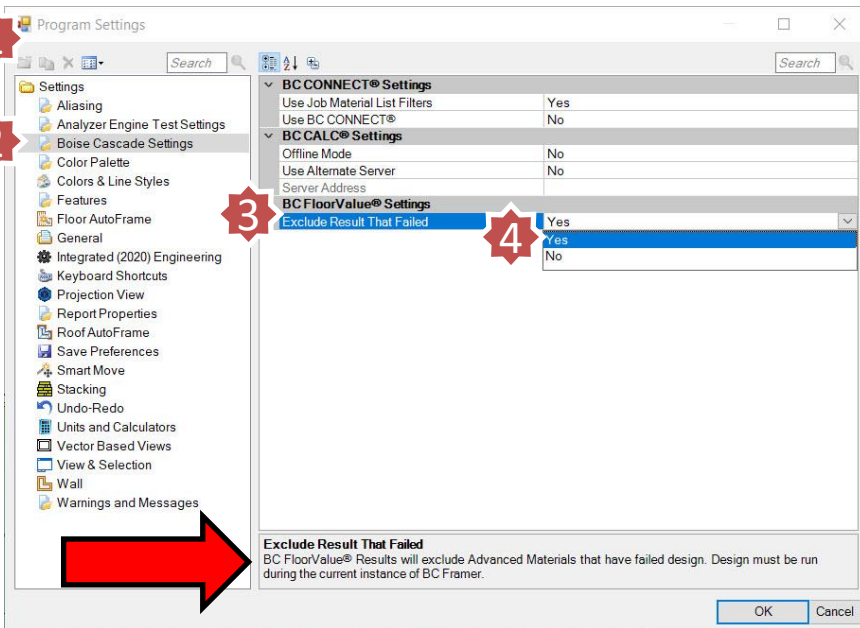

This is the joist list, which is located in the Floor Container Properties

This is the beam list, which is located in the Beam Properties / Advanced Material

(as of version 8.2.3)

❑ BC FloorValue® : Combine Consider List with Floor Value List

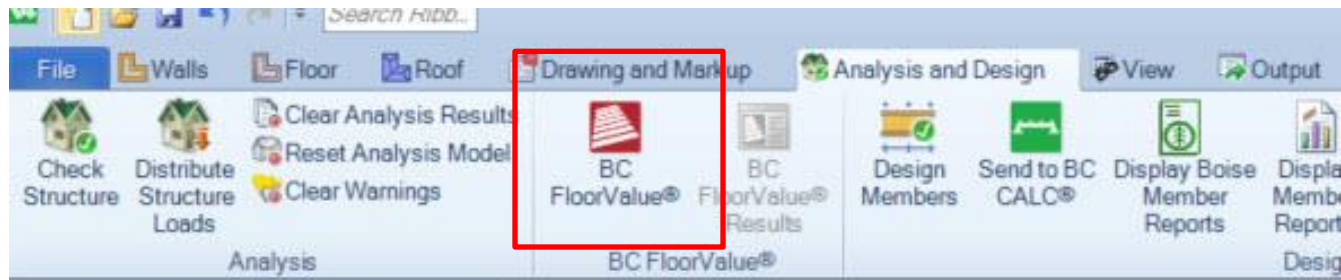

- In the past, we could get BC FloorValue® results that fail design.

Run BC FloorValue®

Click the BC FloorValue® icon on the Analysis and Design tab –

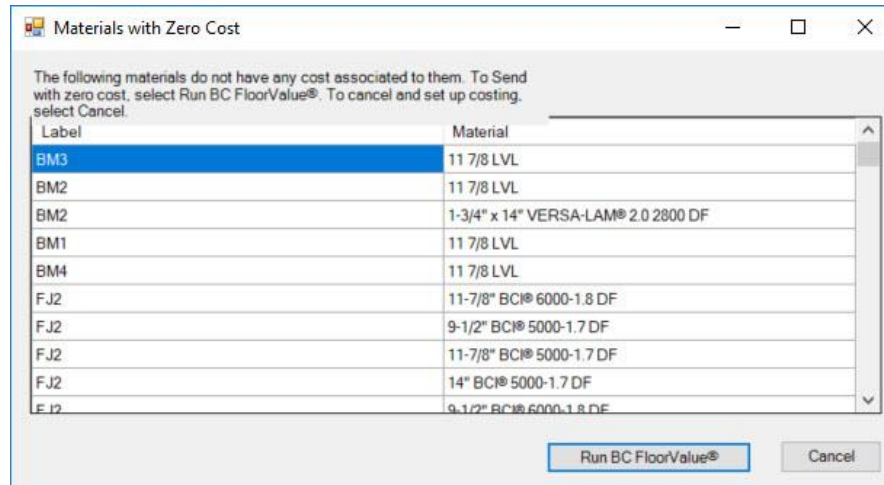

- all floor containers in the model will be included in the command.

- To analyze a single floor container, select any joist in the container. Only that floor container will be included in the command.
(Check Structure and Distribute Structure Loads will also run in the background.)

Materials with Zero Cost

If any products in your model or framing options do not contain a price in Materials the “Materials with Zero Cost” dialog will display a list of materials.

This dialog is informational only. It is intended to aid in adding prices to the Materials database to take full advantage of the cost comparison tool in BC FloorValue®.

Click Run Analysis to run BC FloorValue® without adding prices.

Click Cancel to end the command.

To take full advantage of the cost comparison feature in the Results dialog it is recommended that prices be added to all listed materials.

Deflection Heat Map

- Based on all live and dead loads, no pattern loading considered
- Analyzes floor as a system, taking into account deflection of supporting members
- Visually alerts the user to locations of differential deflection across the floor system
- Helps identify potential problem areas where occupants notice uneven floor deflection

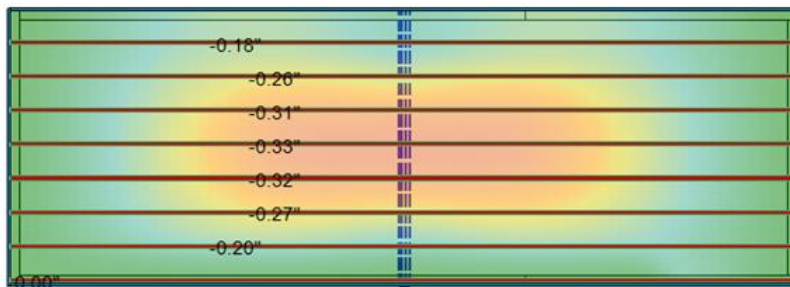

Deflection Heat Map

- Displays System deflection rather than single member design values.

A. Rigid Wall at mid-span

B. Weak Beam at mid-span

System Deflection Scale				
Worst				Best

Deflection Heat Map: Example

Problem:
Island joist deflects 0.25" more than adjacent joists when deflection of supporting beam is considered.

Deflection Heat Map

Potential Problem:
Joists exceed design
criteria of
L/480 live load and
L/360 total load but
simple span joist
deflects 0.24" more
than adjacent
continuous span
joists.

Vibration Analysis

Basement		
FC1	11-7/8" BCI® 5000s-1.8-16" o.c.s.	Enhanced
	3/4" 4x8 OSB	Premium

- Based on dead loads, no pattern loading considered
- Analyzes floor as a system
- Considers joist, sheathing and support stiffness contributions to performance
- Identifies the overall performance of the floor system and the worst case joist or beam
- Classifies each floor container into one of three categories, Minimum, Enhanced, Premium
- Helps identify potential problem areas where occupants notice floor vibrations independent of the deflection heat map

Vibration Analysis: Ratings

Minimum: The feel of this floor system ranges from the lowest performing floor, which likely is also structurally **inadequate**, to one that is comparable to those designed to the code minimum L/360 live load deflection criteria. The closest comparable deflection range in terms of L-over ratings is L/0 to L/360.

Enhanced: The feel of this floor system ranges from just slightly better than a code minimum floor to one that exceeds a floor designed to the typically recommended L/480 live load deflection criteria. Similar to L/480 being the recommended live load deflection criteria for most I-joist floor systems, Enhanced is the recommended BC FloorValue® rating for most I-joist floor systems. The closest comparable deflection range in terms of L-over ratings is L/361 to L/480.

Premium: The feel of this floor system ranges from just slightly better than Enhanced to one that exceeds a floor designed to Boise Cascade's Four Star L/960+ live load deflection criteria targeted at the more discriminating homeowner. The closest comparable deflection range in terms of L-over ratings is L/481 to L/999+.

It is important to note that the BC FloorValue® rating will not always coincide with the L-over deflection results from the structural analysis or in literature span tables. Structural member design includes pattern loading and does not consider the flexibility of the supports whereas BC FloorValue® does not consider pattern loading and takes support flexibility into account.

Sheathing Analysis

- Considers the worst case sheathing span perpendicular to framing members
- Compares sheathing span to the sheathing's span rating
- Classifies the sheathing for each floor container into one of four categories, Code Minimum, Standard, Enhanced, Premium
- Helps identify potential problem areas where occupants notice soft spots between joists with flexible floor coverings

Decking	Joist Spacing Limit			
	Min. Code	Standard	Enhanced	Premium
19/32" or 5/8" Ply/OSB	19.2"	-	16"	12"
23/32" or 3/4" Ply/OSB	24"	-	19.2"	16"
7/8" or 1" OSB	32"	-	24"	19.2"
1 1/8" Ply/OSB	48"	32"	-	24"

Basement

Selecting Framing and Decking Options

- Selecting a Floor Container in the results table populates the Framing and Decking options

The screenshot shows the 'BC FloorValue Results' window. A table lists floor systems and their associated materials, ratings, and cost changes. A green arrow points from the 'FC3' row in the table to the configuration panel below.

Floor Systems	Modeled Materials	Rating	Selected Materials	Rating	Cost Change	% Change
Total:						
					(\$790.02)	-18%
Basement
