LOOK

Dark, refined and understated. Yet still a highlight. The deep, matt surface of our new locking cylinders establishes a consistent visual concept together with handle sets and lever handles.

FEEL

The skin is the body's most sensitive organ, especially the area around our fingertips. Every time you touch a door knob from our new design range, you can feel its solid quality and velvety texture.

A unique surface

Available in colours that match the current trend of dark tones for door fittings and lever handles, the locking cylinders and mortise locks of the new range become high-quality design elements in their own right.

The visual and tactile qualities of the surfaces are produced by a multi-stage paint and coating process,

which we have developed in-house specifically for this application. It transforms the brass that we use to make our locking cylinders, giving them the velvety feel of blasted aluminium.

The number, size and shape of the fine metal particles in the paint and its colour tones have been matched perfectly to the handle sets from leading manufacturers.

The key to even greater customisation

In the unicolour variant, all visible parts of the cylinder are painted in the desired colour.

With the bicolour variant, the cylinder plug is nickel-plated with a polished finish that contrasts with the darker, slightly rougher surroundings. Even when installed in high-usage areas, the polished surface is very resistant to wear.

Aesthetically pleasing and highly flexible

The look and feel of our new design range is available in conjunction with many of our locking solutions and also for our certified fire protection locks. So these functional elements can perfectly fit in with your building's design concept.

Our electronic CES OMEGA FLEX double knob cylinders are also available in the new design range, combining a velvety feel and refined look with ultimate functionality.
