+ Design

# We are working for the day every child has a home.

We operate in the flooring industry, but the reason we exist goes much deeper than our daily tasks.

Helping orphaned and abandoned children is the heart of why we exist. There is great need and great opportunity for us to contribute to the lives of children in need. This is why we exist.

## Our 4 Areas of Focus

- Homes for abandoned children
- Adoption grants
- Family preservation
- Education opportunities

*"There are over 153 million children orphaned around the world. Additionally, there are 168 million child laborers and 263 million children unable to attend school, causing generational poverty and child abandonment issues that last for generations."*

*- United Nations International Children's Emergency Fund (UNICEF)*

# Choosing The Right Floor

*Ultimately, the question in every homeowner's mind comes down to: what flooring is best for my home? To help answer that, we've grouped the ever-expanding types of flooring into two main groups: natural wood floors and watersafe floors.*

## The Benefits of a Natural Wood Floor

To keep it simple, our definition of a natural wood floor is any flooring that has natural wood as its top most wear layer.

Natural wood floors have the unique beauty and characteristics of the trees they are made from. Wood floors are carbon-friendly, environmentally sustainable, and last for generations when properly cared for.

### MORE BENEFITS INCLUDE:

- A warm surface to walk and live on
- Can be refinished and renewed many times
- No repeating patterns that are the tell-tale signs of an imitation wood floor
- Added value to a home
- Easy cleaning and maintenance

## The Benefits of a Watersafe Floor

A watersafe floor is usually any hard surface floor covering that has a artificial or composite base layer. The top layers consist of photographic representations of wood flooring and is protected by a clear plastic wear layer (usually measured in "mils"). Technology has advanced to make these floors affordable, attractive, and hassle-free.

### MORE BENEFITS INCLUDE:

- Water resistance
- Installation over less than ideal subfloors
- DIY friendly
- Highly scratch resistant
- Versatile installation in any area of a home

## Making the Best Choice

Homeowners today have more flooring options to consider than ever before. With these ever-increasing flooring options, it is vitally important to consider and match the room to the lifestyle.

# Wood Flooring As An Investment

*Wood flooring can be a smart choice for many projects, offering homeowners timeless beauty and tangible benefits.*

## 3 Main Benefits:

1. Durability & Longevity
2. Impact on Property Value
3. Better Cost Benefits

Genuine hardwood floors, whether solid or engineered, enhance home projects by adding value and beauty.

For engineered floors, opt for a wear layer of at least 3mm for multiple re-sanding opportunities. The choice between factory-finished and site-finished options depends on project needs, each offering unique advantages. Hardwood flooring is a long-term investment that boosts durability, appeal, and market value. With proven longevity, aesthetic versatility, and a substantial return on investment, selecting the right wood floor can elevate a home's quality and value.

Wood flooring is more than just a detail — it's a foundational element that reflects the quality and care put into a home.

## Durability and Longevity

Wood has been utilized for centuries due to its enduring beauty and durability. Part of that durability comes from the ability to re-sand most wood floors, unlike disposable alternatives such as carpet, LVP, and laminate. With the ability to rejuvenate through refinishing, traditional residential wood floors boast an estimated service life of 75 years.

## Impact on Property Value

Wood flooring proves to be a valuable short-term and long-term investment for homes.

According to the 2022 National Association of Realtors' Remodeling Impact Report, refinishing existing wood floors (147% ROI) or installing new wood floors (118% ROI) are the top two projects with the highest return on investment before selling a home.

Additionally, 90% of consumers express a greater desire to be at home, and 77% report increased enjoyment after refinishing or installing wood floors. In every aspect, wood floors emerge as a financially rewarding investment, contributing to an enhanced living experience.

## Cost-Benefit Analysis

Choosing flooring with timeless aesthetic appeal and long-lasting durability offers the added benefit of avoiding the high costs, time, and disruption associated with floor replacement.

Opting for wood flooring can avoid the expenses and inconveniences of unnecessary replacements. Although hardwood floors may have a higher initial cost compared to vinyl, laminate, or carpet, their easy maintenance and longevity make them a superior choice in most cost-benefit analyses.

MATERIAL	INITIAL INSTALLED COST	ESTIMATED USEFUL LIFE	MAINTENANCE REQUIRED	MAINTENANCE FREQUENCY	COST PER YEAR
Solid Wood	\$10.92	75 Years	\$5 Sand & Finish	10 Years	\$0.54
Engineered Wood	\$8.92	30 Years	\$2.50 Screen & Recoat	10 Years	\$0.57
Ceramic Tile	\$9.53	75 Years	\$2 Grout Cleaning	3 Years	\$0.79
Porcelain Tile	\$11.38	75 Years	\$2 Grout Cleaning	3 Years	\$0.82
Nylon Broadloom Carpet	\$5.63	10 Years	\$0.35 Carpet Cleaning	3 Years	\$0.72
Rigid Core SPC	\$6.36	15 Years	Replace	N/A	\$0.61
Laminate	\$6.49	15 Years	Replace	N/A	\$0.62
Sheet Vinyl	\$7.10	15 Years	Replace	N/A	\$0.67

Prices listed are per sqft.

Sources: RSMeans Database & EPD/Life Cycle Analysis Documents of Products

## Consider Your Costs

Flooring is part of every new construction budget. The critical point to consider: typically, only 40-60% of the total cost of a floor is in materials, while up to half the cost is labor. When choosing a cheaper, disposable floor, you minimize your savings but miss out on all the benefits of a wood floor.

As an example, note the difference between selecting wood flooring against a rigid core vinyl floor:

COST CATEGORY	WOOD COST PER SQFT	RIGID CORE COST PER SQFT
Materials	\$6.00	\$4.00
Subfloor Prep	\$1.00	\$1.00
Installation	\$4.00	\$4.00
Trim/Moldings/Etc.	\$0.25	\$0.25
<b>Total</b>	<b>\$11.25</b>	<b>\$9.25</b>

Opting for a rigid core floor to cut material costs by 50% only saves 25% on the total project cost. You also lose out on the beauty, longevity, and elevated home value that wood provides.

# How to Care For Wood Floors

*Cleaning hardwood flooring shouldn't be confusing. Properly caring for and maintaining wood floors is the best way to help them last for a lifetime.*

Our Recommendation:

## How To Clean

These simple steps are easy and will keep your flooring looking great for years to come:

- Remove dust and debris with a dry microfiber dusting pad, vacuum or broom. Always use the hard surface setting on your vacuum.
- Clean tough spots with a damp cloth by hand.
- Spray the cleaning solution across the area you desire to clean.
- Mop with the microfiber cleaning pad in the direction of the wood grain, not across it. Rinse pad as you clean or switch to a new clean pad when cleaning a large area.
- Rinse the cleaning pad with warm soapy water or clean in the washing machine.

## What To Use

- ✓ Microfiber dusting pad
- ✓ Vacuum or soft-bristle broom
- ✓ Microfiber cleaning pad
- ✓ Hardwood safe cleaning solution

## What To Avoid

- Wet mops
- Steam cleaners
- Oil soaps, waxes, or polishes
- Straight or diluted vinegar, ammonia or alkaline products

## When To Clean

### DAILY

- Dry mopping, sweeping or vacuuming can be done daily as needed.
- High traffic areas usually need to be swept every day.
- Low traffic areas can be less frequent.

Always wipe up spills right away with a cloth or paper towels.

### WEEKLY

- Spray and clean once per week, or more as needed.
- Kitchens, hallways, entryways and living areas need the most attention.
- Stains and grime will get harder to clean the longer you wait.
- Always use a wood floor safe cleaner.

# Where Can Wood Floors Be Installed?

*There are limitations on which grade levels of a home wood floors can be installed.*

	SOLID	ENGINEERED
Above Grade	✓	✓
On Grade	✓	✓
Below Grade	X	✓

Above Grade	Flooring installed in levels that sit above ground level. Multi-story homes, split level homes, and high-rise apartments will have “above grade” levels.
On Grade	Flooring installed on ground level, but not below. If installing over a concrete slab or crawl space, the flooring must be at the recommended moisture content.
Below Grade	Flooring in spaces below ground level. Basements, walk-out basements, and ground-contact homes are all considered “below grade.”

## Solid

### Where to install:

- Dry conditions
- Homes with plywood subfloors
- On grade levels (same level as ground outside)
- Above grade levels (not basements)

## Engineered

### Where to install:

- Over concrete
- Homes with elevated moisture content
- When intending to glue down or float the flooring

# Reactive Stains

*Have you ever wanted something truly unique? Something that wasn't mass produced or looked like what everyone else had?*

Reactive stains create completely unique color tones in a wood floor. While traditional stains cover the flooring surface with a consistent color, a reactive stain affects the unique identity of every plank to create exceptionally beautiful and original color.

This stain process reacts with the wood at the granular level, transforming the actual wood fibers to create unique appearances. Some boards are darkened throughout the entire structure of the hardwood, rather than the visible surface. Other floors are more dynamic with some wood grain changing in one way, while other grain elements react differently.

This creates multiple tones and sometimes color variations within a lot of flooring during production.

**No two boards will be identical, and color tones can vary from lot to lot.**

A good rule of thumb is to see how the flooring looks in different types of lighting, especially if you're installing the flooring in multiple rooms.

Floors with reactive stain can look very different in a dark hallway versus a living room with a lot of natural light. We understand that job sites and installation schedules are often hectic, so it may seem easier to skip this step. However, prioritizing this can save you from losing time and money later.

## Can you approve the floor based on a sample board?

It's best to order a box or two of the current lot before making your final decision. We do not recommend a final approval of a prefinished wood floor based solely on a sample board.

Over time, samples can fade or darken due to sunlight, air, cleaning, and other factors. The color and appearance are also affected by interior lighting.

While sample display boards are helpful to compare different flooring colors, they are only intended to help make buying decisions. Treat them like you would paint swatches.

You are not likely to paint all of your walls based on a small paint swatch in a store. You would want to see that paint on the wall before painting your whole house.

Flooring samples should be treated the same.

*A final approval should always be done in the home with the lot of flooring to be installed.*

### Confirm the Color Before Buying

- Open at least one box of flooring.
- Look at the flooring with the other decor pieces in the room. See how it looks next to paint, furniture, cabinets, and other wood pieces.
- Move boards to several areas that has different lighting. Places to try are hallways, rooms with incandescent lighting, and spaces near windows.

# The Truth About "Waterproof" Flooring

*Welcome to a conversation that's long overdue in the flooring world. "Waterproof flooring" has become a buzzword, often used more for its marketing appeal than its technical accuracy.*

When choosing a floor, you'll see plenty of products labeled as "waterproof."

But what does that really mean?

If you're choosing a floor for a home with kids, pets, or high-traffic areas, it's essential to know the real deal about water damage, mold risks, and what warranties actually cover.

## How Water Affects Floors

Water can damage flooring in three ways:

**SPILLS & LEAKS:** Kitchen appliance malfunctions, plumbing issues, or pet accidents can lead to water pooling on top of floors.

**SUBFLOOR MOISTURE:** Water can seep up from the foundation, often unnoticed until damage occurs.

**EXCESS HUMIDITY:** High humidity can lead to condensation, which may get trapped under flooring.

While "waterproof" floors won't warp or swell when exposed to moisture, the real concern is what happens **underneath**. If water gets trapped between the floor and subfloor, mold and mildew can grow, leading to structural damage and health risks.

## What About the Warranty?

Many homeowners assume a "waterproof" label means total protection. However, most flooring warranties do not cover water damage from flooding, subfloor moisture, or mold issues. That's why it's crucial to read the fine print before purchasing.

## Choosing the Right Floor for Wet Areas

In low-moisture rooms like bedrooms and living spaces, water resistance isn't a major concern. But for kitchens, bathrooms, and basements, you'll want watersafe options, such as:

- Rigid Core SPC
- Watersafe Laminate
- Wood Composite Flooring

### What to Look For:

**WATER-RESISTANT CORE:** The material itself resists moisture or is coated in water-resistant material.

**WATER-TIGHT LOCKING SYSTEM:** Prevents water from seeping through seams.

**CERTIFIED TESTING:** Products should pass the 100-Hour Water Test or NALFA Water Resistance Test.

For best water protection, follow the manufacturer's installation instructions.

### Protecting Your Investment

To keep your flooring in top shape:

- Clean spills immediately.
- Use a hygrometer to monitor indoor humidity (ideal: 35-55%).
- For major water damage, consult professionals to assess and replace affected flooring. Even with "100% waterproof" products, removing and replacing the affected area may be necessary to prevent mold growth.

### Find the Perfect Floor

Most "waterproof" floors are really water-resistant—great for everyday spills but not immune to flooding or moisture buildup. The key to long-lasting flooring? Understand the limitations, choose a floor with the best watersafe features, and take preventive measures to keep the home safe and mold-free.

### The Real Risk: Mold and Mildew Problems

The risk of mold and mildew is often overlooked when considering flooring as "waterproof."

While water itself may not harm such floors, the real issue stems from mold and mildew caused by water trapped underneath.

Left unchecked, these unseen growths can damage flooring, subfloors, walls, and cabinets.

To prevent mold and mildew, a flooded floor must be removed, and the subfloor thoroughly cleaned and dried before installing new flooring. It is not a good idea to attempt to reuse waterproof planks if they are damaged during removal, preventing proper reinstallation.

# Comparing Your Watersafe Options

Whether renovating a cozy corner of a home or planning a major project, understanding the nuances of watersafe flooring is vital to making an informed decision.

Choosing the right flooring is not just a matter of aesthetics but also practicality, durability, and budget. Let's dive into the world of watersafe flooring and discover the best option for your project!

## Suitability for Different Rooms

Watersafe floors are great for almost any room in the home, with only a couple of exceptions:

- Vinyl floors are not ideal for sunrooms or areas exposed to large temperature fluctuations.
- Laminate floors are not ideal for areas around a shower or bathtub or anywhere else with frequent water standing on the floor for extended periods.

## Wood Composite

### PROS

- All the pros of laminate plus:
- Highest scratch resistance and durability
- Can be installed in longer runs and larger space before needing transitions
- Can install in wet areas like bathrooms

### CONS

- Some dust at install
- Can't be glued

## Laminate

### PROS

- More durable and scratch resistant than Rigid Core SPC
- Resistant to fading and discoloration
- More authentic wood look and feel

### CONS

- Some dust at install
- Can't be glued down
- Prolonged exposure to water permanently damages core

## Rigid Core SPC

### PROS

- Not permanently damaged by moisture
- More scratch resistant than wood
- Does not expand or contract with humidity changes

### CONS

- Fragile locking mechanism
- Temperature swings and direct sunlight can affect plank stability
- Least environmentally friendly option

# The Eighteen Seventy-Five Collection

In early 19th century London, Marc Brunel pioneered a new technique for slicing veneers from hardwood lumber. Perfected in 1875, this efficient process preserves the natural wood grain, making it the most beautiful and economical way to build an engineered floor. Our Eighteen Seventy-Five Collection celebrates this marvel of engineering.

From The Silvan Collection

The neutral canvas of the Silvan Collection brings beauty and warmth underfoot while accommodating nearly every decor style. Themes of organic textures, natural elements and faded tones offer a simple and understated foundation to add your unique style to, or bring an entire room to life as the crown jewel of the space. Inspired by classic Nordic stylings, the simple nature of this collection draws us closer to the essentials of life and proves once again less is more and great design is timeless.

# Distillery

From The Vintage Loft Collection

Vintage Loft derives its character from the plank floors of the industrial buildings of previous generations, the warehouses and factories in downtowns and commercial districts throughout the world. Over time, some of these buildings are repurposed into living spaces and retain the rustic charm of their utilitarian origins. Like your father's leather jacket, your favorite reading chair, or those treasured blue jeans, these floors are warm, welcoming and perfectly worn in.

# Constellation

## Barrel

From The Storehouse Plank Collection

In generations past, storehouses and utility buildings were built with rough milled hardwood lumber, valued for its strength and durability. Now, time and use have revealed the inherent beauty within, displaying the authentic honesty of real wood. The Storehouse Plank collection captures the centuries of aged perfection in every solid plank.

### Featured Partners

# Teckton

## *Unfinished Engineered Hardwood*

Most flooring professionals are tired of flooring installations that delay their timelines. Whether it's unacclimated wood or missing supplies, these delays in completing an installation can be costly.

What if you had one product that provided for a reliable installation every time?

With consistent quality milling and no acclimation needed, Teckton Unfinished Engineered Flooring installs fast, keeping you on time at every job.

### Fast Installation

- Pre-sanded to 100 or 120 grit
- Easy fit from precise milling
- No plywood needed
- Matches up to carpet and tile

### Beautiful Look

- Consistent grading
- Square edge, no bevel
- Long, random lengths (some specs up to 7')
- Sawn-cut wear layers reveal the natural character and look of solid wood floor grain
- Fully customizable: add texture, color, and finish of choice

### Better Performance

- More dimensionally stable in high moisture environments than solid
- Thick re-sandable wear layers
- Standard thickness, 5/8"; some species and widths available in 9/16" or 3/4"

Species & Grade	Thickness	Available Widths
White Oak Prime Grade	5/8"	2-1/4, 3-1/4, 4, 5, 6, 7, 8"

# Installing the Floor

***You've heard it said: "follow the manufacturer's instructions" when doing a wood floor installation. It is a temptation to only rely on past experience during a flooring installation.***

For professionals, it can seem redundant to go over the basics for every job. After all, you do this for a living, right?

How different could this floor be from the last X number of floors you've installed? The answer is: more than you might think.

Different products have nuances, and the manufacturer's instructions tell you the best application of the product based on how it was designed.

The best time to prevent a costly problem is before it happens. Using the same methods on all floors may work the majority of the time, but can eventually cost you in a big way.

## Installation Is Acceptance

Before anything is installed, confirm that the flooring at the jobsite is the correct one - the right collection, species and color.

Just like approving sample paint on the walls before painting a whole house, we recommend loose laying a box of flooring for the homeowner to approve before installation.

Open a box or two of flooring and rack it out so the homeowner can see and approve the color, texture

and size of the floor. Taking this step might be the most important thing you can do. Wood is a natural product with variation in its appearance, color, and texture. It's impossible to represent the full breadth of this variation in a sample board.

We have witnessed the rare, but unfortunate incident where a perfectly good (and gorgeous!) floor had to be torn out and replaced all because it did not meet the homeowner's expectation for color, character, texture, or other reason that could have easily been caught before installation.

Next, inspect the flooring as it is being installed. Check boards to ensure appropriate color and texture, good milling, straight boards, and no obvious defects. Do not install any boards that are questionable. If more than 5% of the floor does not meet expectations, stop and contact us.

## Protect Your Liability By Knowing What To Do

We cannot recommend strongly enough that you read and follow every manufacturer's installation instructions. Period, full stop.

It's easy to forget the difference between each manufacturer's guidelines and the next. Details can get muddled in the middle of a job.

To help keep things straight, we've put together a quick list of 5 steps to do for every flooring installation.

**Remember:** The installer is the final inspector of the floor. If a defect could have been caught before installation, it is typically not covered by a warranty after installation.

# 5 Steps To Do For Every Wood Floor Installation

This list is not intended as a substitute for reading and following the manufacturer's installation instructions and the National Wood Flooring Association's guidelines.

## 1. Approve the Product

Have your customer sign off on the floor after you inspect the flooring for damaged or defective boards.

## 2. Acclimate The Floor

Know the manufacturer's recommended acclimation guidelines. Measure and make sure the flooring and environment are at the correct levels.

## 3. Check the Subfloor

A new floor likely won't fix a squeaky subfloor! Make sure it's clean, dry, flat and structurally sound before installing over it.

## 5. Inform the Customer

Help the homeowner protect their investment by giving them clear, correct maintenance and environmental guidelines for their floor.

## 4. Use the Right Fasteners or Glue & Trowel

Make sure the fastening system is sufficient for the floor, per the manufacturer. Use a glue assist method with nail down floors to prevent squeaks and noises.

# Installation Methods

*Always follow the full manufacturer and National Wood Flooring Association guidelines when installing a hardwood floor. Here's a brief overview of how our flooring can be installed.*

Type of Floor	Float	Nail-Down	Glue-Assist	Glue-Down
Engineered	✓	✓	✓	✓
Solid	✗	✓	✓	✓
Watersafe	✓	✗	✗	✗

## Floating A Floor

Any of our engineered floors (4" and wider), LVP and watersafe floors can be floated over a subfloor. Floating a floor is a great method to use if you have a sound, level subfloor, or if you have a floor you do not want to remove and want to cover, like worn out tile, vinyl, or other hard surface flooring. If the product does not have a locking mechanism, be sure to use tongue and groove glue that's approved for floating wood flooring.

## Nailing Down A Floor

A nail down installation is a fast and time-tested way to install a tongue and groove wood floor. This method can be prone to squeaks, creaks and other noises as the floor expands and contracts through the seasons. The best way to avoid squeaks is to follow the manufacturer's guidelines and NWFA's recommendations. We highly recommend using a glue-assist method with nailed down floors over 4" wide to reduce squeaks and other noises.

## Gluing Down A Wood Floor

If you are installing flooring directly to a concrete slab or want to prevent movement over a plywood subfloor, a full glue-down method is best.

## Glue Assist Method

All wood floors are susceptible to squeaks, creaks or to emitting other noises. This is usually due to the wood's expansion and contraction with change in moisture. It may be aggravated by dry or wet air conditions, subfloor movement, and using the wrong fasteners or seating the fasteners incorrectly.

A glue-assist method can help by securing the boards to the subfloor and reducing potential for movement and noises. To use a glue-assist method, the adhesive must be in direct contact with the flooring and subfloor. No underlayment is to be used. If a vapor retarder is needed, use a roll-on moisture barrier approved for the subfloor type and glue being used.

Ensure that the air and moisture conditions above and below the flooring are properly maintained. Always follow the manufacturer and/or NWFA guidelines for glue-assist installations.

Basements, crawl spaces, or concrete slabs must be tested for moisture before installation. If needed, appropriate moisture mitigation techniques can be applied before using a glue-assist method.
